Google Search Console

Q-1. Set up Google Search Console (GSC) for a demo website you control (can be a free GitHub Pages site or any blog you own), and verify ownership using the HTML tag method.

Ans:

Steps:

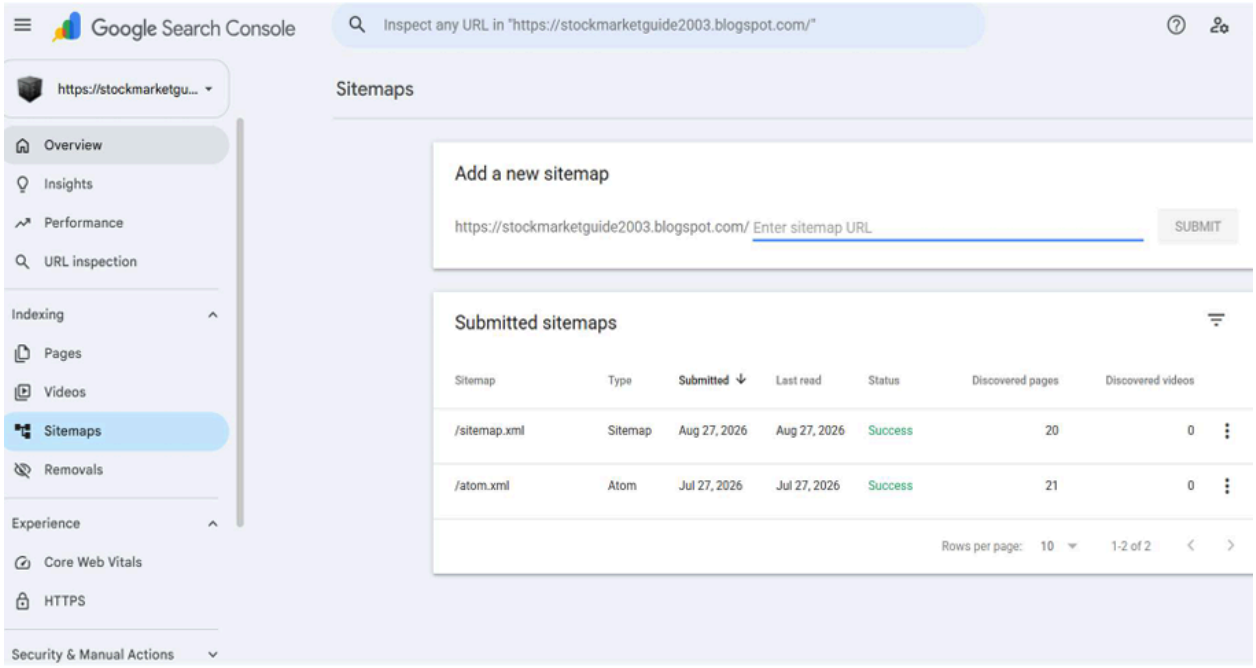

1. Open Google Search Console.
2. Sign in with your Google account.
3. Add your website as a property.
4. Select the **HTML tag** verification method.
5. Copy the verification meta tag provided by Google.
6. Add the meta tag inside the `<head>` section of your website's homepage.
7. Return to Google Search Console and click **Verify**.

Result:

Google Search Console was successfully set up for the demo website, and ownership was verified using the HTML tag verification method.

Q-2. Submit a sitemap for your demo site in Google Search Console and take a screenshot showing the sitemap status after submission.

Ans:

Q-2. Submit a sitemap for your demo site in Google Search Console and take a screenshot showing the sitemap status after submission.

Ans:

Steps:

1. Generate an XML sitemap for your website.
2. Upload it to your website's root directory.
3. Open Google Search Console and select your website property.
4. Navigate to **Indexing** → **Sitemaps**.
5. Enter the sitemap URL, such as `sitemap.xml`.
6. Click **Submit**.
7. Check the sitemap status after submission.

Result:

The XML sitemap was successfully submitted in Google Search Console. The sitemap status was checked after submission.

Screenshot: Attach a screenshot of the actual sitemap submission and its status from Google Search Console.

Q-3. Open the Performance report in Google Search Console and identify the top 3 queries that brought users to your site in the past 28 days. Write down the queries and their total clicks.

Ans:

No query data was available during the last 28 days because the demo website had not yet received search traffic.

Search Query	Total Clicks
No query data available	0
No query data available	0
No query data available	0

Explanation:

The website may not have received enough Google Search impressions or clicks during this period. Search query data can appear when Google indexes the pages and users find the website through Google Search.

Q-4. Use the URL Inspection tool in Google Search Console to inspect a specific page of your site. Request indexing for that page and note any issues or suggestions GSC provides.

Ans:

Inspected URL:

`https://stockmarketguide2003.blogspot.com/2026/07/stock-market-success-tips-every.html`

Result:

The URL Inspection tool confirmed that the page was on Google and indexed. I requested indexing for the page, and Google confirmed that the URL was added to a priority crawl queue.

- The page is served over HTTPS.
- One valid Breadcrumbs item was detected.
- No major indexing issue was shown.

Q-5. Apply the GSC Queries Trick: In the Performance report, use a regular expression filter to find queries that are exactly 8 words long (using the pattern `(\b\w+\b\s){7}`). List any queries found, or explain why none appeared.

Ans:

No matching queries were available because the website had not yet received enough Google Search impressions or clicks.

Steps:

1. Open Google Search Console.
2. Navigate to **Performance** → **Search results**.
3. Select the **Query** filter.
4. Choose **Custom (regex)**.
5. Enter the pattern:

(\b\w+\b\s){7}

6. Apply the filter and review the matching queries.
