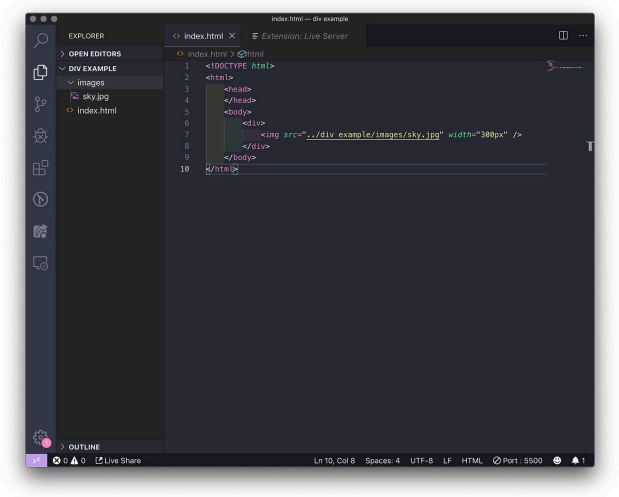
Image SEO

11.1

Question: Download any 3 images from your favorite food delivery app (like Zomato or Swiggy), rename each file to a descriptive, SEO-friendly name...

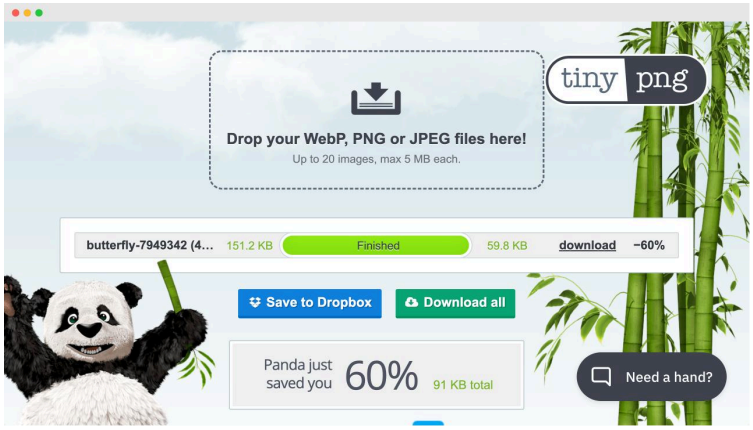
11.2

Question: Add an <img> tag for a product image (e.g., a sneaker from Myntra) in an HTML file and write a clear, keyword-rich alt text...



3.

Compress one of your images to under 100KB using an online tool (like TinyPNG or Squoosh), then compare the original and compressed file sizes and describe how this impacts website loading speed.



4.

Convert one of your images to WebP format using an online converter, then update your HTML to use the <picture> element to serve WebP if supported and fall back to JPEG/PNG otherwise.

Hint: Use the <source> tag inside <picture> for WebP and <img> for fallback.

HTML

```
<picture>
    <source srcset="pizza.webp" type="image/webp">
    <img src="pizza.jpg" alt="Cheese pizza">
</picture>
```

5.

Implement lazy loading for three images on a sample web page by adding the loading="lazy" attribute, then open the page in your browser and use the network tab to observe when each image actually loads.
