Mobile SEO

Q-1. Open any one of your favorite websites (like Myntra, Zomato, or BookMyShow) on your mobile and desktop browser, then list 3 differences you notice in layout, navigation, or features. Explain how these differences relate to mobile-first indexing.

Ans:

I selected Myntra and compared its desktop and mobile layouts.

No.	Desktop	Mobile
1	The navigation bar displays many categories such as Men, Women, Kids, Home, and Beauty.	The navigation is more compact and uses icons or menu options to save screen space.
2	Product listings can show many products side-by-side.	Products are generally displayed in fewer columns for easier viewing on a small screen.
3	Search, profile, wishlist, and shopping bag options have more space.	These features are optimized into smaller icons and touch-friendly controls.

Relation to Mobile-First Indexing:

Google primarily uses the mobile version of a website for crawling and indexing. Therefore, important content, links, and functionality available on the desktop version should also be available on the mobile version. A responsive mobile layout improves usability and supports SEO.

Q-2. Create a simple HTML page for a 'Foodie Review' app homepage and use CSS media queries to make the navigation bar responsive for mobile screens.

Ans:

```
<!DOCTYPE html>
<html lang="en">
```

```
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Foodie Review</title>

  <style>
    body {
      margin: 0;
      font-family: Arial, sans-serif;
    }

    nav {
      background: #E23744;
      padding: 15px;
      display: flex;
      justify-content: space-between;
      align-items: center;
    }

    .logo {
      color: white;
      font-size: 22px;
      font-weight: bold;
    }

    ul {
      display: flex;
      gap: 25px;
      list-style: none;
      margin: 0;
    }

    ul a {
      color: white;
      text-decoration: none;
    }

    @media only screen and (max-width: 600px) {
      nav {
        flex-direction: column;
        gap: 15px;
      }

      ul {
```

```
            flex-direction: column;
            text-align: center;
            gap: 10px;
            padding: 0;
        }
    }
  </style>
</head>

<body>
  <nav>
    <div class="logo">Foodie Review</div>

    <ul>
      <li><a href="#">Home</a></li>
      <li><a href="#">Restaurants</a></li>
      <li><a href="#">Reviews</a></li>
      <li><a href="#">Contact</a></li>
    </ul>
  </nav>
</body>
</html>
```

Explanation:

The `@media only screen and (max-width: 600px)` media query changes the navigation from horizontal to vertical on mobile screens, making the website easier to use on smartphones.

Q-3. Use Google's Mobile-Friendly Test tool to analyze any one page from a popular Indian app website (like IRCTC, Flipkart, or Paytm). Take a screenshot of the results and list 2 mobile usability issues reported.

Ans:

Website selected: Flipkart

Two mobile usability issues:

1. **Touch targets are too close together:** Buttons or links placed too close to each other can make it difficult for mobile users to tap the correct option.

2. **Text is too small to read:** Small text can make a webpage difficult to read without zooming on a smartphone.

Screenshot: Open the selected webpage in an available mobile usability or page-testing tool and attach a screenshot of the actual results.

Note: These are example usability issues from the assignment. Verify which issues, if any, are reported for your selected page before submitting.

Q-4. Implement a basic Accelerated Mobile Page (AMP) version of a 'Movie Ticket Booking' landing page with AMP HTML boilerplate and one image. Validate your AMP page using the official AMP validator.

Ans:

```
<!doctype html>
<html amp lang="en">
<head>
  <meta charset="utf-8">
  <title>Movie Ticket Booking</title>

  <link rel="canonical"
      href="https://example.com/movie-booking.html">

  <meta name="viewport"
      content="width=device-width,minimum-scale=1,initial-scale=1">

  <script async src="https://cdn.ampproject.org/v0.js"></script>

  <style amp-boilerplate>
    body {
      -webkit-animation: -amp-start 8s steps(1,end) 0s 1 normal both;
      -moz-animation: -amp-start 8s steps(1,end) 0s 1 normal both;
      -ms-animation: -amp-start 8s steps(1,end) 0s 1 normal both;
      animation: -amp-start 8s steps(1,end) 0s 1 normal both;
    }

    @-webkit-keyframes -amp-start {
      from { visibility: hidden; }
      to { visibility: visible; }
    }
```

```
      @keyframes -amp-start {
        from { visibility: hidden; }
        to { visibility: visible; }
      }
    </style>

    <noscript>
      <style amp-boilerplate>
        body {
          -webkit-animation: none;
          -moz-animation: none;
          -ms-animation: none;
          animation: none;
        }
      </style>
    </noscript>

    <style amp-custom>
      body {
        font-family: Arial, sans-serif;
        margin: 20px;
        text-align: center;
      }

      h1 {
        color: #d92332;
      }

      .book-button {
        display: inline-block;
        background: #d92332;
        color: white;
        padding: 12px 20px;
        text-decoration: none;
        border-radius: 5px;
      }
    </style>
  </head>

  <body>
    <h1>Movie Ticket Booking</h1>

    <amp-img
```

```
      src="https://placehold.co/600x350"
      width="600"
      height="350"
      layout="responsive"
      alt="Movie theatre and cinema screen">
    </amp-img>

    <p>Book your favorite movie tickets online.</p>

    <a href="#" class="book-button">Book Tickets</a>
</body>
</html>
```

Validation steps:

1. Save the code as `movie-booking.html`.
2. Open the AMP Validator.
3. Enter the HTML code or provide the URL of your hosted page.
4. Run validation and review any errors.
5. Fix errors and validate again.

Expected Result: The page should pass AMP validation when all required AMP rules are satisfied and the image URL is accessible.

Note: Replace the example canonical URL and placeholder image with appropriate URLs. Attach a screenshot of the actual validator result after testing.

Q-5. Download a standard mobile optimization checklist from a trusted SEO blog or resource, then review your own portfolio site (or any small site you manage) against this checklist and write down 3 specific improvements you could make for better mobile SEO.

Ans:

No.	Issue	Current Situation	Improvement
1	Image Size	Large images may slow down mobile loading.	Compress images and use the WebP format.
2	Navigation	Desktop navigation may occupy too much mobile space.	Use a responsive hamburger menu.

3	Page Speed	Too many scripts and images can increase loading time.	Remove unnecessary scripts and optimize CSS and JavaScript.
